The specification describes an isolated protein which is specifically immunoreactive with antibodies present in individuals infected with HEV and encoded by a sequence contained in an open reading frame (ORF) of an HEV genome. The genome has a sequence that is more than 70% identical to the ORF1 sequence from Burma HEV isolate. The protein is used as a vaccine and a diagnostic probe for ET-NAMB. (Updated on 25-MAR-2003 to correct OR field.)

mutants which are capable of cross rescting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins can be used in vaccines for immunising against HEV infection. The swine HEV can be used in vaccines for immunishing against HEV infection. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

Identifying recombinant antigen immunoreactive with antibody induced by hepatitis E virus (HEV), for detecting HEV infection, comprises immunoreacting a polypeptide from an HEV genome with an HEV-positive antiserum.

Claim 6; Col 63-68; 46pp; English.

The present invention describes a method for identifying a recombinant antigen immunoreactive with a hepatitis B virus (HEV)-induced antibody. The method comprises producing a polypeptide derived from an HBV genome, immunoreacting the polypeptide with an HBV-positive antiserum and selecting the polypeptide as a recombinant antigen if the polypeptide reacts with the HBV-positive antiserum. The method is useful for identifying recombinant antigen immunoreactive with antibody induced by HBV. The enterically transmitted non-A/non-B hepatitis (ET-NANB (also known as HBV))-specific fragments are useful for identifying ET-NANB. Whom as HBV) specific fragments are useful for identifying ET-NANB viral genomic material in a patient sample, for the synthesis of polypeptides for use in immunoassays, and for identifying synthesis of polypeptides for use in immunoassays, and for identifying similar antispenic regions encoded by related viral strains, e.g. Burmese strain. The antigens are especially useful in the preparation of vaccine against ET-NANB infection. These antigens may further be used to prepare antiodies to ET-NANB virus particles for use directly as antiviral agents, and to produce antiserum designed for pre- or post-exposure prophylaxis. The present sequence represents a specifically claimed HEV Burma strain protein sequence for use in the present invention

The invention relates to an isolated DNA comprising the genome of an referrically transmitted nonA/nonB (ET-NAMB) viral hepatitis agent (also referred as HEV). The DNA sequences or their fragments are useful in preparing ET-NAMB viral proteins and as probes for virus detection. These are particularly useful in diagnosing infection by an enterically transmitted agent (e.g. ET-NAMB virus), as well as in vaccine production. The Present sequence represents a ORF2 protein encoded by a ET-NAMB viral DNA sequence from HEV-Burma strain
  in vaccine production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PheTrpGlyAspArgValAspSerGlnProPheAla1leProTyr11eHisProThrAsn

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in a sample and isolating HEV agents or nucleic acid fragments produced by the agent. The method utilises PCR - using bile from a human or cynomolgus monkey actively infected with HEV as a source of the agent. The method of the invention is used for detecting the presence of a viral agent in a sample of cultured cells infected with the agent and isolating enterically transmitted nonA/nonB HEV agents or nucleic acid fragments produced by the agent. The present amino acid sequence represents the protect mecoded by open reading frame 2 (ORR2) of a DNA sequence isolated from a Burmese strain of the Hepatitis E virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting the presence of enterically transmitted nonA/nonB hepatitis viral (HEV) agents in bile samples from infected humans and monkeys using polymerase chain reaction.
                                                                                                CATACTTTTGATGATTTCTGCCCAGAGTGCCGCCCCCTTGGCCTTCAGGGCTGCGCTTTC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein derived from an enterically transmitted non-A/non-B viral hepatitis agent. The viral proteins are useful for detecting infection by the enterically transmitted non-A/non-B (BT-NANB/HBV) hepatitis viral agent. The proteins are also useful for producing vaccines for immunising an individual against HBV hepatitis viral agent. The DNA fragments are useful for identifying and sequencing the entire viral agent and for assaying the viral agent in an infected sample. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                           New proteins derived from an enterically transmitted non-A/non-B (ET-NANB) viral hepatitis agent, useful for diagnosing ET-NANB infection and producing vaccines for immunizing an individual against ET-NANB hepatitis viral agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

This sequence represents a Hepatitis E viral hollow particle protein. This polypeptide can be used to raise antibodies to detect HEV infection in samples, e.g. by immuno-assay based techniques, and the nucleic acid can be used for the same in nucleic acid hybridisation assays. The polypeptides and nucleic acids allow more accurate detection of HEV than previously possible
                                                                                                                                                                                                                                                                                  ArgProThrThrAlaGlyAlaAlaProLeuThrAlaValAlaProAlaHisAspThrPro

The nucleic acid sequence may be used for identifying and sequencing the entire viral agent (also referred to as HEV), detecting ET-NANB in infected samples, e.g. by specific amplification of virus-derived DNA sequences and for producing recombinant viral proteins for use in vaccines. (Updated on 25-MAR-2003 to correct PF field.)

62K antigen (AAR96091) comprises the C-terminal 549 amino acids of Phepatitis E virus (HEV) Burma strain capsid protein (see also AAR96089). It is obtd. by PCR amplification of HEV Burma ORF-2 (AAT27107), insertion of amplified DNA (AAT27109) into vector pGBX and expression in B. coll cells. Expression of full-length ORF-2 in Sf9 insect cells using a baculovirus system also results in prodn. of 62K antigen (see also AAR96103). 62K represents an improved antigen, in comparison to bacterial expressed proteins, for use in HEV diagnostic assays, and also has excellent immunogenic properties. HEV is a non-enveloped virus. HEV polypeptide is useful for studying the pathogenesis of HEV and monitoring treatment efficacy in subjects undergoing treatment for HBV. The polypeptide is used as a reagent to detect HBV and as a vaccine to treat or prevent HEV infection. The present sequence is HBV long capsid protein encoded by open reading frame 2, also referred as pORF2

DNA (AAT27109) coding for the 62K antigen (AAR96091) of hepatitis E virus (HEV) Burma strain capsid protein was cloned into baculovirus expression vector pabluaecill and recombinant 62K was expressed in Sf9 insect cells. High levels of expression were obtd, and the recombinant 62K was obtd. in over 95% purity. However, C-terminal processing resulted in the deletion over 95% purity. However, C-terminal processing resulted in the deletion of 9 or 23 amino acids from 62K, giving 2 related polypeptide species (AAR96101 and AAR96103). Similar results were obtd. with HEV Mexico 62K antigen (see also AAR96102 and AAR96104). Recombinant 62K represents an improved antigen, in comparison to bacterial expressed proteins, for use in HEV diagnostic assays, and also has excellent immunogenic properties. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ACCCATATAATGGCCACGGAAGCTTCTAATTATGCCCAGTACCGGGTTGCCCGGTGCCACA 573

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Characterization of a prototype strain of hepatitis E virus.";

Proc. Natl. Acad. Sci. U.S.A. 89:559-563(1992).

-!- FUNCTION: CONTAINS A HIGH BASIC AMINO ACID CONTENT SUGGESTING

THAT IT MAY BE INVOLVED IN THE ENCAPSIDATION OF THE GENOMIC RNA

BY EFFECTIVELY NEUTRALIZING THE NEGATIVELY CHARGED RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-09-851-410A-6_COPY_5147_7129 (1-1983) x VST2_HEVPA (1-660)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Proc. Natl. Acad. Sci. U.S.A. 99:996-1001(2002).
-!- FUNCTION: Seems to be the binding site for several of the factinvolved in protein synthesis and appears to be essential for accurate translation (By similarity).
-!- SIMILARITY: Belongs to the L12P family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Clostridium perfringens.
